Patent No. 5946658

GENERAL INFORMATION:

APPLICANT: Landry Donald, W.

TITLE OF INVENTION: ANTI-COCAINE CATALYTIC ANTIBODY

NUMBER OF SEQUENCES: 108

CORRESPONDENCE ADDRESS:

ADDRESSE: Cooper and Dunham Lib

STREST: 1185 Avenue of the Americas

CITY: New York

STREST: 1185 Avenue of the Americas

COUNTRY: USA

ZIP: New York

COUNTRY: USA

ZIP: PODOS/MS-DOS

SOFTWARE: PRACATION DATE:

COMPUTER: IBM PC Compatible

OPERATION SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENTE PATENTION NUMBER: US/08/672,345C

FILING DATE: 24-UUN-1996

CLASSIFICATION NUMBER: US/08/672,345C

FILING DATE: 24-UUN-1996

CLASSIFICATION NUMBER: US/08/672,345C

TELECOMMUNICATION INPORMATION:

REGISTRATION NUMBER: 28/678

REGISTRATION NUMBER: 0575/51400

TELEPRAN: 212-239-0525

INFORMATION FOR SEQ ID NO: 97:

SEQUENCE CHARACTERISTICS:

LENGTH: AmbrENGES estimates

TYPE: amino acide

TTELERAL IS anino acide

TTELERAL IS ANINO ACIDE

TELENGTH: IS ANINO ACIDE

TELENGTH: IS ANINO ACIDE

TELERAL IS ACIDE

Aprile: Amino acid sequence of the light chain variable region of M511, a phosphorylche Aprile: amino acid sequence of the light chain variable region of M511, a phosphorylche Apecession: A01910

Apocession: A01910

Apocession: A01910

Apocession: A01910

Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.

Comment: This chain was isolated from a myeloma protein that binds phosphorylcholine.

Comment: An amunoglobulin hererotectramer submit consists of two identical light (kap hain disulfide bonds. In some cases, such as Igh and IgM, the submits associate into la constantine immunoglobulin V region; immunoglobulin homology

```
A; Wolecule type: DNA
A; Residues: 1-112 < CATA
A; Experimental source: strain Balb/c
A; Note: this sequence was determined from the germline gene
C; Comment: This sequence was isolated from a hybridoma protein that binds influenza virus he
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Reywords: hererotetramer; immunoglobulin
P;16-95/Domain: immunoglobulin homology < IMM>
                                                                                                                                                                                                                                                                                                                                                                                                 Ig kappa chain V region (H158-89H4) - mouse

"Variation in mitochondrial cytochrome b sequence in natural
populations of South American akodontine rodents (Muridae:
Sigmodontinae).",

Mol. Biol. Bvol. 8:85-103(1991).

-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-cl complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

-!- SUBUNIT: The main subunits of complex b-cl are: cytocomposition of and the Rieske protein (By similarity)
-!- SIMILARITY: Belongs to the cytochrome b family.

"Variation in mitochondrial cytochrome b sequence in natural
"Variation in mitochondrial cytochrome b sequence in natural
populations of South American akodontine rodents (Muridae:
Sigmodontinae)."

Mol. Biol. Bvol. 8:88-103(1991).

-!-FINCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-c1 complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis (By similariby).

-!-COPACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or
bsc2) is low-potential and absorbs at about 562, and heme 2 (or in
bsc2) is high-potential and absorbs at about 566 (By

-!- FUNCTION: Complex III or cytochrome b-cl complex), which is a complex (complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).

-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or BH or b566) is high-potential and absorbs at about 562, and heme 2 (or BH or Similarity).

-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 similarity).
-!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,
cytochrome c1 and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.

Smith America: evidence from cytochrome b.";
J. Mammal. Evol. 6:89-128(1999).
-!- FUOTION: Component of the ubiquinol-cytochrome c reductase complex (complex (complex III or cytochrome b.c.l complex), which is a respiratory chain that generates an electrochemical potential complex (A AFP Synthesis (By similarity).
-!- COTACTOR: Binds two heme groups non-covalently. Heme I (or BL or b562) is low-potential and absorbs at about 562, and heme 2 (or Br or b566).
                                                                                                                                                                                                                                                                                                                                                  InterPro; IPR005798; Cytb_b6 C.

                                                                                          similarity).
-!- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b, cytochrome c1 and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        similarity).
SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity).

--- SUBNUT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity).
--- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Submitted (FEB-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL c b562) is low-potential and absorbs at about 562, and heme 2 (or b b566) is high-potential and absorbs at about 566 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Phylogenetic relationships and species limits within Phyllotis (Rodentia: Sigmodontinae): concordance between mtDNA sequence and morphology.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                similarity).
-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                   .

-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b,
cytochrome cl and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.

Phylogenetic relationships and the radiation of sigmodontine rodents "phylogenetic relationships and the radiation of sigmodontine rodents in South America: evidence from cytochrome b.";
J. Mammal. Evol. 6:89-128(1999).
-!- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-cl complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
-!- COFACTOR: Binds two heme groups non-covalently. Heme 1 (or BL or b563) is low-potential and absorbs at about 562, and heme 2 (or BH or b563) is high-potential and absorbs at about 566 (By

    similarity).
    SUBUNIT: The main subunits of complex b-c1 are: cytochrome b, cytochrome c1 and the Rieske protein (By similarity).
    SIMILARITY: Belongs to the cytochrome b family.

                                                                                                                                                                                                                                                                                                   .;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A

COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A

EXESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL

COUPLED TO ATP SYNTHESIS (BY SIMILARITY)

C --- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY

C --- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY

C --- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY

C --- SUMILARITY: BELONGS TO FC COMPLEX B-C1 ARE: CYTOCHROME B,

C CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

C STAILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROWE C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-CI COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERALIES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY)
-!- COFACTOR: TWO HEME GROUPS (BS62 AND BS66) WHICH ARE NOT COVALENTLY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

EXECUTION FOR THE PROPERTY OF THE UNIQUENCE FROM N.E. PAULON OF SUBMODUTION OF THE UBIQUINOL-CYTCCHROME C REDUCTASE COMPLEX (COMPLEX (COMP
BOUND TO THE PROTEIN (BY SIMILARITY).

C. 1- SUBJUNT: THE MAIN SUBNINTS OF CONFLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

C. 1- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

"Whylogenetic relationships among european red deer, wapiti, and sika deer inferred from mitochondrial DNA sequences.";

Mol. Phylogenet. Evol. 15:115-123(2000).

-!- PUNCTION: CONVENDENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX II OR CYTOCHROME B-C1 COMPLEX), WHICH IS A RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL COUPLED TO ATP SYMTHESIS (BY SIMILARITY).

-!- COPACTOR: TWO HEME GROUPS (18.62 AND 18.66) WHICH ARE NOT COVALENTLY BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBUNIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B, CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

EMBL; ABROINOS TO THE CYTOCHROME B FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Uruguay.";

J. Mammal. 83:408-420 (2002)

-!- FUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE

COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A

RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL

COURLED TO APP SYNTHESIS (BY SIMILARITY).

-!- COFACTOR: TWO HEME GROUDES (BS562 AND BS56) WHICH ARE NOT COVALENTLY

BOUND TO THE PROTEIN (BY SIMILARITY).

-!- SUBJUILT: THE MAIN SUBJUITS OF COMPLEX B-C1 ARE: CYTOCHROME B,

CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

-!- SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

ALL J. Marmall. 83:408-420(2002).

C. I. PUNCTION: COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE
COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), WHICH IS A
RESPIRATORY CHAIN THAT GENERATES AN ELECTROCHEMICAL POTENTIAL
COUPLED TO ATP SYNTHESIS (BY SIMILARITY).

C. I. COPACIOR: TWO HEME GROUPS (BSES AND BSS6) WHICH ARE NOT COVALENTLY
BOUND TO THE PROTEIN (BY SIMILARITY).

C. SIBLINIT: THE MAIN SUBUNITS OF COMPLEX B-C1 ARE: CYTOCHROME B,
CYTOCHROME C1 AND THE RIESKE PROTEIN (BY SIMILARITY).

C. SIMILARITY: BELONGS TO THE CYTOCHROME B FAMILY.

EMBL; AF454769; AAM33836.1; ---
SIMICARITY: BELONGS TO THE CYTOCHROME B FAMILY.

Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis.

Claim 1; Page 40; 81pp; English.

This sequence represents complementarity determinating region 3 (CDR L3) of the light chain of murine anti-CD23 (FCBRII) monoclonal antibody Cl1 (see also AAV32262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of Cl1 light and heavy chain CDRs (see AAV32254-59) to

                                                                                                                                                                                                                                                                                                                       ö
haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus eryhematosus. Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatilis, postidais, urticaria, nephrotic syndrome, glomerulonephritis, psoriadis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, crohn's disease, Sjogren's syndrome, allergies, allergic asthma, intrinsic asthma actute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, (CDP, insulitis, bronchitis, arthcularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CD23; FCERII; IgE receptor; monoclonal antibody; C11; mouse; human; monoclonal antibody; chimeric antibody; humanised antibody; complementarity determining region; CDR; autoimmune disease; inflammation; arthritis; lupus erythematosus; multiple sclerosis; Hashimoco's thyroiditis; diabstes; uveitis; dermatitis; psoriasis; urticaria; nephrotic syndrome; glomerulonephritis;, inflammatory bowel disease; ulcerative colitis; Crohn's disease; slogram's syndrome; allergy; asthma; thinitis; eczema; insulitis; graft.versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy;

```
This sequence represents the light chain variable region (VL) of humanised anti-CD23 (FCERII) monoclonal antibody Cl1, composed of a human tramework (HSIGKVII) and the light chain complementarity determining regions (see AAY3224-56) of murine antibody Cl1. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, such as confinence or humanised antibodies, which comprises sufficient of the amino commence of the Cl1 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II determining regions to render them capable of binding to the CD23 type II activities, lugus erythematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lugus erythematosus, Haahimoto's thyroiditis, multiple arthritis, judiabetes, uveltis, inflammatory bowel disease, ulcerative colitis, communicatory disease, ulcerative colitis, communicatory allergies, allergic asthma, cute asthmatic exacerbation, rhinitis, cozema, graffturinsic asthma, acute asthmatic exacerbation, rhinitis, cozema, graffturinsic asthma, acute asthmatic exacerbation, rhinitis, cozema, graffturinsic asthma, acute asthmatic the pronditis (particularly chronic pronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cD23; FCERII; IgB receptor; monoclonal antibody; C11; mouse; monoclonal antibody; chimeric antibody; humanised antibody; complementarity determining region; CDR; autoimmune disease; inflammation; arthritis; lupus erythematosus; multiple sclerosis; Hashimocto's thyroiditis; lubus erythematosus; multiple sclerosis; urticaria; nephroiditis; diabetes; uveitis; dermatitis; psoriasis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; slogren's syndrome; allergy; asthma; rhinitis; eczema; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy;

This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody C11. The invention provides anti-CD23 (FCERII) monoclonal antibody C11. The invention provides CC altered antibodies, such as chimeric or humanised antibodies (see ANY32262 and AAY32263), which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions (see AAY32254-59) to render them capable of binding to the CD23 type II molecule expressed on hadmatopoietic Cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lugus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes uvelits, dermatitis, psoriasis, uriccaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative collitis, crohn's disease, Sjogren's syndrome, allergic asthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft: bronchitis) or diabetes (particularly type I diabetes), and B-cell mallignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and determining the binding agents Murine, p53 protein, monoclonal antibody, mAb, PAb-421, IDI-1, IDI-1 L3, light chain variable region; VL, complementarity determining region; CDR, dematrological; immunosuppressive, antiniflammatory, autoimmune response, SLE, systemic lupus erythematosus; diagnosis, treatment; autoantigen; DNA-binding domain; anti-idiotypic antibody. Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Murine, p53 protein, PAb-421, monoclonal antibody, mAb; IDI-1, anti-idiotypic antibody; DNA-binding domain; dermatological; immunosuppressive, antiinflammatory; autoimmune response; SLE; systemic lupus erythematosus; diagnosis; treatment; autoantigen; light chain variable region; VL; complementarity determining region; CDR.
                                                                                                                                                                                                            The patent discloses a method for the treatment of systemic lupus erythematosus (SLB) by down-regulating the autoimmune response to the Creminal DNA-binding domain of p53 protein by an active compound. The present sequence is a IDI-1 L3 Septide which comprises the complementarity determining region (CDR) of the light chain of IDI-1 annoncolonal antibody (Mah). The IDI-1 mah is an anti-idiotypic antibody/Ab2 mah specific for PAb-421 which is an Ab1 mah specific to the C-terminal DNA-binding domain of murine p53 protein. The peptide corresponds to residues 92-110 of IDI-1 light chain variable region. It is an example of the active compound useful in the diagnosis, prevention and treatment of SLB in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                              Treatment of systemic lupus erythematosus by down-regulating the autoimmune response to the C-terminal DNA-binding domain of the protein by an active compound comprising of antibodies to p53 or fragments of p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /label= CDR

                                                                                                                                                                                      The patent discloses a method for the treatment of systemic lupus erythematosus (SLE) by down-regulating the autoimmune response to the C-terminal DNR-binding domain of p53 protein by an active compound. The present sequence is a light chain variable region of IDI-1 an anti-idiotypic antibody/Ab2 monoclonal antibody (mAb) specific for PAb-421 which is an Ab1 mAb specific to the C-terminal DNR-binding domain of murine p53 protein. The Ab1 and Ab2 mAbs and peptides based on complementarity determining regions Of light and heavy chain variable regions of these antibodies, are examples of active compounds useful in the diagnosis, prevention and treatment of SLE in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New chimeric mouse human antibodies - used in treatment, diagnosis and

The mouse VL gene product may be used to produce chimeric mouse- human Abs against HIV-1 comprising human Ig constant regions and murine variable regions. These novel sequence are useful in treatment, diagnosis and prophylaxis of HIV infections, and may be produced by a bacterial, yeast or mammalian expression system. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the light (kappa) - chain variable (V) region of a mouse monoclonal antibody (MAb), 2E12, and is specific for an HIV-1 viral hantigen. It is used in the construction of a chimeric MAb comprising heavy and light chains having murine V regions and human C regions. The chimeric MAbs are more effective than murine MAD 2E12 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (J) regions, to generate restriction enzyme reocgnition sites. The chimeric MADs can be used as immuno- conjugates, in association with e.g. toxins for HIV retearment. They can also be used in diagnosis of HIV. See also AAQ12057-63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW39821-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2A10 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                              New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                    Variable domain; lambda light chain; catalytic antibody; degradation; cocaine transition state analogue; TGA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

The present sequence represents the light chain of a catalytic antibody which is capable of degrading cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The mattbodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New catalytic antibodies able to decompose cocaine, single-chain
analogues - used to treat cocaine overdose and addiction, required in fa
smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Variable domain, lambda light chain, catalytic antibody, degradation, cocaine, cocaine transition state analogue, TSA, benzoic acid, phenyl cocaine, immunogenic conjugate, reduction, cocaine, treatment, overdose, addiction.
Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction

                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                      New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                            AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (TSAS) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2M10 antibody (AAW3980) represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse, humanised antibody, CC-chemokine receptor 2, CCR2; nephrotropic, neuroprotective, immunosuppressive, human immunodeficiency virus; neuroprotection, cytostatic, vasotropic, leukocyte trafficiking, allergy; inflammatory disorder; autoimmune disorder; rheumatoid arthritis; shock, multiple sclerosis; atherogenesis; atherosclerosis; restenosis; asthma; anaphylaxis; malignancy; inflammation; stenosis; allograft rejection; fibrotic disease; angioplasty; acquired immune deficiency syndrome; AIDS; inflammatory glomerulopathy; vascular intervention; neointimal hyperplasia; VK; kappa light chain variable region.

fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comparising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting leukocyte trafficking, for treating CCR2. They care useful for inhibiting leukocyte trafficking, for treating cCR2-mediated disorders such as inflammatory disorder, autoimmune disorders such as rhemmacold arthritis and multiple sclerosis.

CCR2-mediated disorders such as inflammatory disorder, autoimmune medicament for treating cCR2-mediated disease. They are also useful for treating allergy, anaphylaxis, and in the manufacture of a medicament for treating CCR2-mediated disease. They are also useful for inflammation, histamine and IgB- mediated allergic reaction, shock, stenosis, allograft rejection, fibrotic disease, asthma, inflammatory sassociated with vascular intervention, including angioplasty and/or stent placement in a mammal. Humanised antibodies are also useful for inhibiting narrowing of the lumen of a vessel in a mammal, and inhibiting necessive in the present of a vessel in a mammal, and inhibiting including and proper and a vessel in a mammal, preferably associated in the conting an intervention. The present sequence is mouse germline kappa
                                                                                                                                                     Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

AAW39915-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 3B9, which is able to degrade cocaline. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
                               New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW39801-05 represent the amino acid sequences of the variable domain of
the Kappa light chain of catalytic antibodies which are able to degrade
cocaine. A series of cocaine transition state analogues (TSAs) were

prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 12H1 antibody (AAM39808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine transition state analogues (FSAS) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3H9 antibody (AAW39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Variable domain; lambda light chain; catalytic antibody; degradation; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

The present sequence is an agonist antibody clone to the human WSX receptor, which can be used to identify and purify ligands and activators. An anti-wSX receptor antibody can be used as an agonist to citivate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy to bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, can also be used demaclogical disorders, inypertension, insulin resistance, hypercholesterolaemia, hypertriglyceridaemia, cancer and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-08-672-345C-95

Sequence 95, Application US/08672345C

Patent No. 5948658

GENERAL INFORMATION:

APPLICANT: Landary Donald, W.

TITLE OF INVENTION: ANTI-COCAINE CATALYTIC ANTIBODY

NUMBER OF SEQUENCES: 108

CORRESPENDENCE ADDRESS:

ADDRESSE: Cooper and Dunham LLP

STREET: 1185 Avenue of the Americas

CITY: New York

STATE: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 7, Application US/08672345C
